I. THE COMPLETELY ANTI-SYMMETRIC SYMBOL

Consider the following completely antisymmetric object

$$\tilde{\epsilon}_{\mu\nu\sigma\rho} = \begin{cases} +1 & \text{if } \mu\nu\sigma\rho \text{ are even permutation of } 0123, \\ -1 & \text{if } \mu\nu\sigma\rho \text{ are odd permutation of } 0123, \\ 0 & \text{otherwise.} \end{cases} \quad (1)$$

The main question we want to answer here is whether $\tilde{\epsilon}_{\mu\nu\sigma\rho}$ is a tensor. Consider the combination

$$\tilde{\epsilon}_{\mu\nu\sigma\rho} \frac{\partial x^\mu}{\partial x'^\alpha} \frac{\partial x^\nu}{\partial x'^\beta} \frac{\partial x^\sigma}{\partial x'^\gamma} \frac{\partial x^\rho}{\partial x'^\delta} = \tilde{\epsilon}_{\mu\nu\sigma\rho} J_\alpha^\mu J_\beta^\nu J_\gamma^\sigma J_\delta^\rho, \quad (2)$$

where we have used the notation

$$J_\alpha^\mu \equiv \frac{\partial x^\mu}{\partial x'^\alpha}. \quad (3)$$

To obtain some intuition about what the above combination is equal to, consider a two-dimensional example with

$$J_\alpha^\mu = \begin{bmatrix} a & b \\ c & d \end{bmatrix}. \quad (4)$$

We then have

$$\tilde{\epsilon}_{\mu\nu} J_\alpha^\mu J_\beta^\nu = J_\alpha^0 J_\beta^1 - J_\alpha^1 J_\beta^0. \quad (5)$$

These are for equations, one for each choice of α, β . Let's tabulate the results for each possible choice: These results

α	β	$\tilde{\epsilon}_{\mu\nu} J_\alpha^\mu J_\beta^\nu$
0	0	$ac - ca = 0$
0	1	$ad - cb = \det J$
1	0	$bc - da = -\det J$
1	1	$bd - db = 0$

can be summarized via the simple result

$$\tilde{\epsilon}_{\mu\nu} J_\alpha^\mu J_\beta^\nu = \tilde{\epsilon}'_{\alpha\beta} \det J. \quad (6)$$

The same results apply in four dimensions

$$\tilde{\epsilon}_{\mu\nu\sigma\rho} J_\alpha^\mu J_\beta^\nu J_\gamma^\sigma J_\delta^\rho = \tilde{\epsilon}'_{\alpha\beta\gamma\delta} \det J = \tilde{\epsilon}'_{\alpha\beta\gamma\delta} \left| \frac{\partial x}{\partial x'} \right|, \quad (7)$$

where we have used the common notation $\left| \frac{\partial x}{\partial x'} \right|$ to denote the determinant of the Jacobian for the coordinate transformation $x^\mu \rightarrow x'^\mu$. We can invert the above relation to write

$$\tilde{\epsilon}'_{\alpha\beta\gamma\delta} = \left| \frac{\partial x'}{\partial x} \right| \frac{\partial x^\mu}{\partial x'^\alpha} \frac{\partial x^\nu}{\partial x'^\beta} \frac{\partial x^\sigma}{\partial x'^\gamma} \frac{\partial x^\rho}{\partial x'^\delta} \tilde{\epsilon}_{\mu\nu\sigma\rho}, \quad (8)$$

where we have used the fact that $\det(J^{-1}) = (\det J)^{-1}$. The above is not the transformation law of tensors due to the presence of the determinant of the Jacobian. Thus, $\tilde{\epsilon}_{\mu\nu\sigma\rho}$ is not a tensor, which is why we called it the Levi-Civita *symbol*. In fact, $\tilde{\epsilon}_{\mu\nu\sigma\rho}$ is an example of **tensor densities**.
